

How to Configure Symantec Live Update 1.6 with CensorNet

This document will guide you through the steps needed to configure Live Update 1.6 to download updates to the anti virus database through CensorNet. If you do not have Live Update 1.6, you may download the update from the Symantec web site.

Although this document has been written specifically for Live Update v1.6, the steps should be similar for any later versions of the software.

Instructions

1. Click Start, point to Settings, and then click Control Panel. The Windows Control Panel appears.
2. Double-click Symantec LiveUpdate. The Configuration dialog box appears.
3. Click the Proxy tab.

4. Choose the "Proxy" tab.
5. Choose "I want to customize my proxy settings for Live Update".

6. Ensure "Use proxy server for HTTP" is ticked.
7. Enter the **Private IP** address of CensorNet in the "Address" box.
8. Enter "8080" as the port number.
9. Tick "Authentication Required" and enter the username and password of a user who has unfiltered access on your CensorNet server.

TIP: Set up a user on your PDC or Active Directory called "liveupdate" and set the profile to "unfiltered" in CensorNet. This will ensure that Live Update can always download its update files.
